

1 **50821/FLC/Y64**

ABSTRACT OF THE DISCLOSURE

5 A method and system for scheduling delivery and delivery
of products to buyers. A Mobile Pickup Station (MPS) server
is placed within a computer network and receives product
shipping instructions from buyers or third party sellers. The
MPS server determines optimal pickup points using buyer
commuting information and buyer delivery requests. A portable
10 kiosk or locker station, enclosing buyers' purchases within
individually lockable lockers, is placed at a pickup point
chosen by the buyers. The buyers use access codes, such as a
product ID and password, to unlock the lockers and receive
their purchases.
